Download Student Report

Purpose

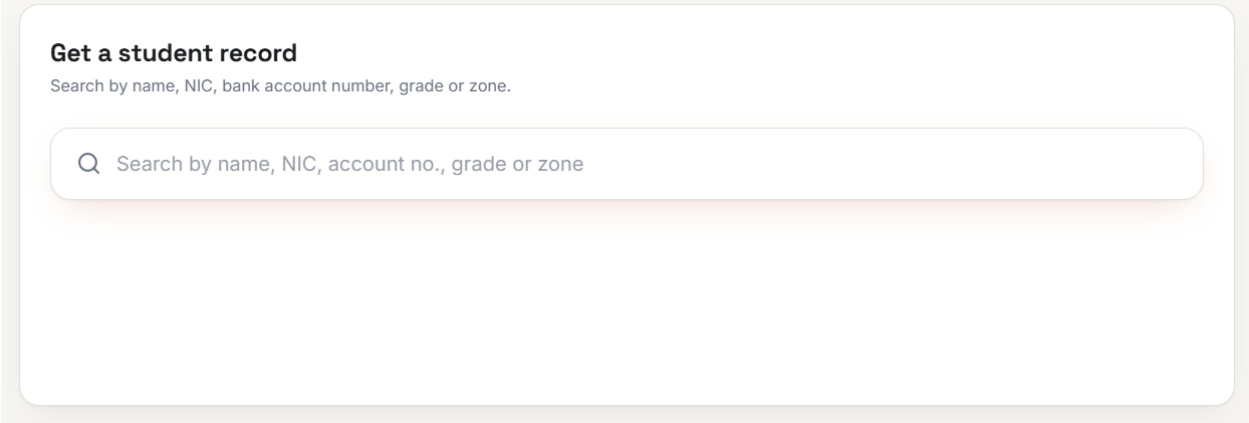

The **Download Student Report** option lets staff look up one student and download a PDF of that student's payment history (every month, paid and unpaid).

How it works for the user

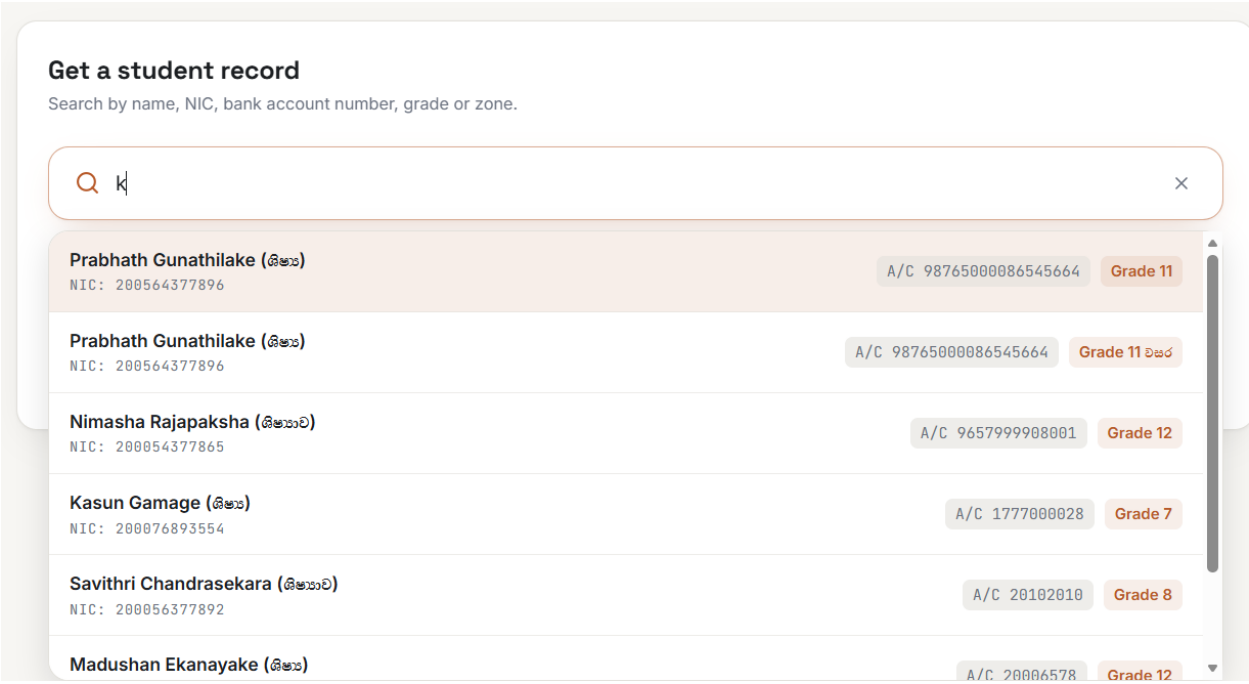

1. On the Payments dashboard, the user clicks **Download Student Report**.

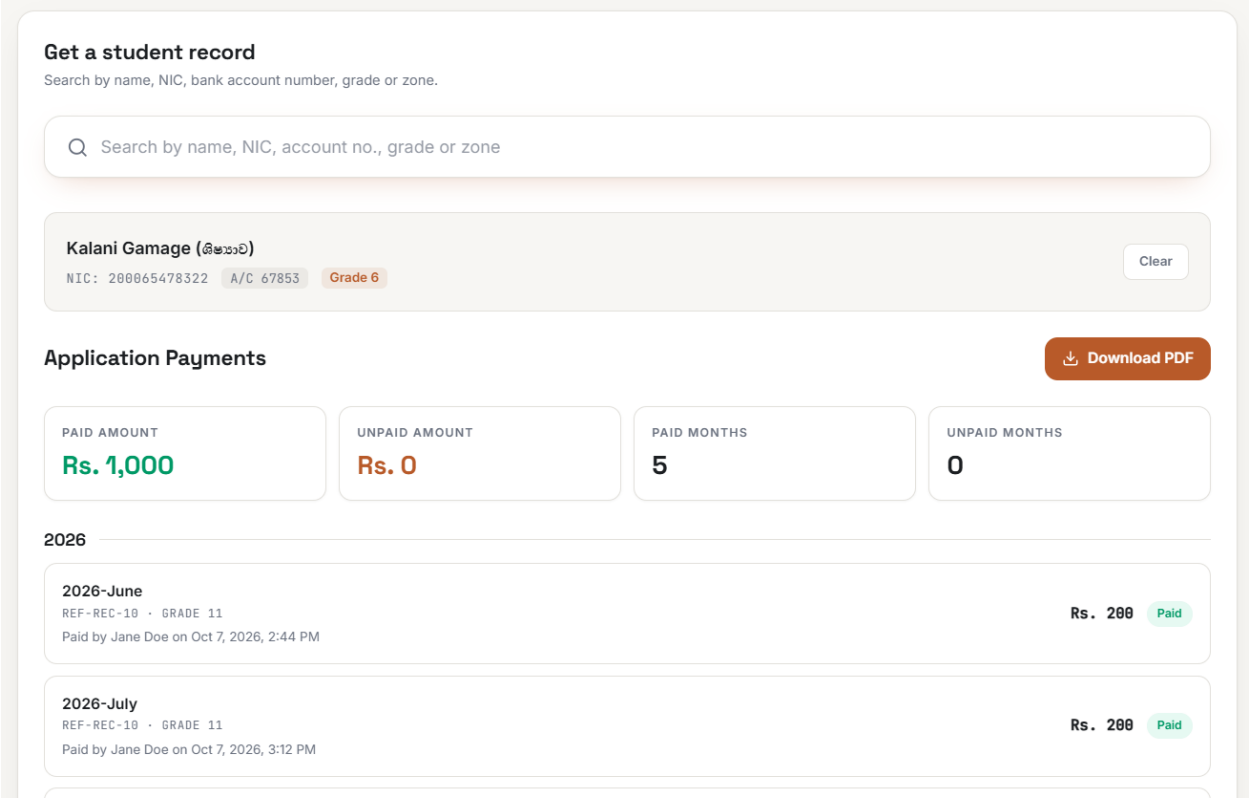

2. The Student Report page opens. The left side shows the same Payments menu, shrunk and blurred, with this option highlighted. The right side is the working area.

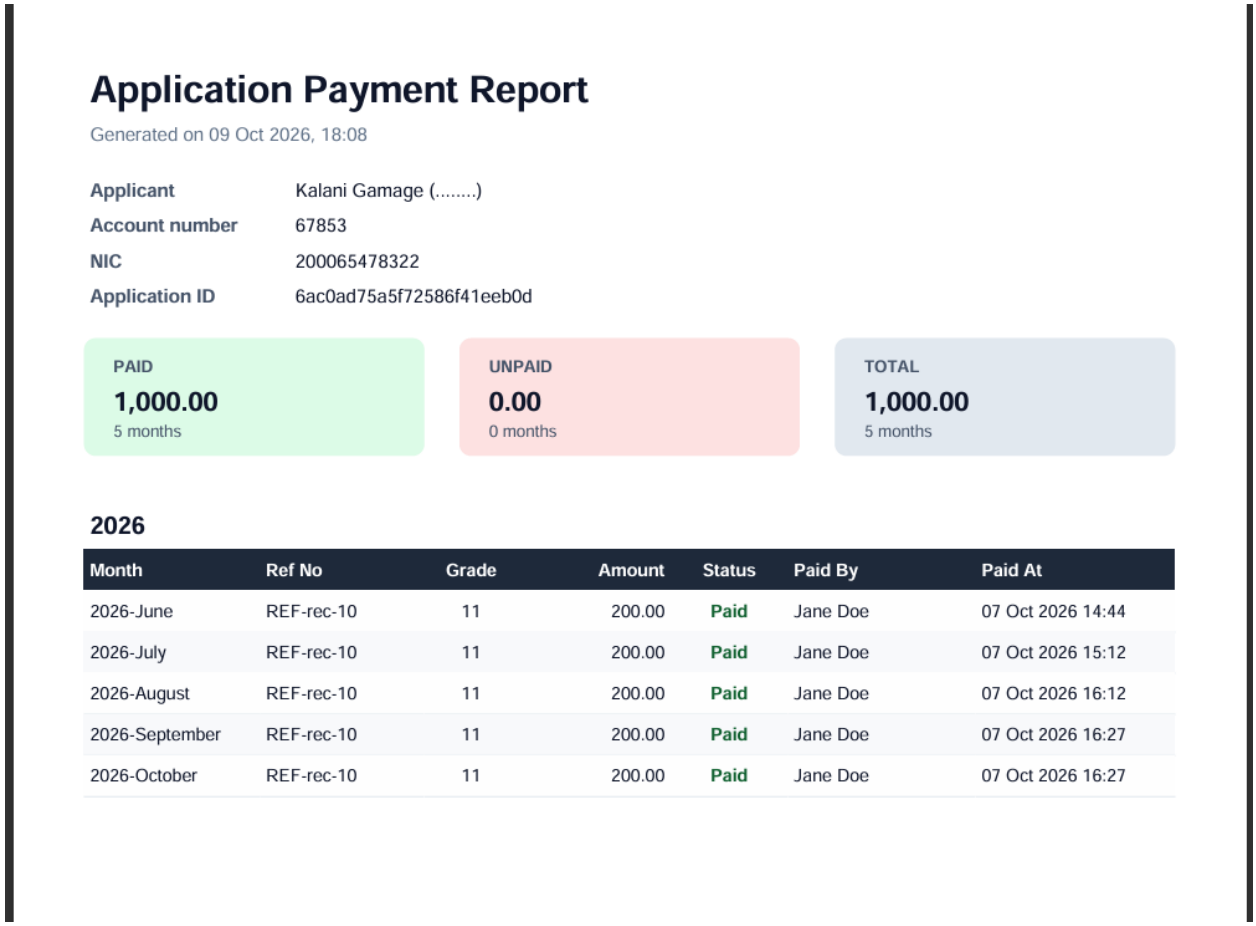

3. The user types a name, NIC, bank account number, grade or zone into the search box. Matching students appear in a dropdown.

4. Selecting a student shows their details (name, NIC, account number, grade), summary tiles (paid and unpaid amounts and months), and a month-by-month payment list grouped by year.

5. Clicking **Download PDF** saves the full payment report as a PDF file.

Application Payment Report

What each file does

Frontend

- **StudentReportPage:** The page layout. It has the header, the profile and sign-out menu, the menu card on the left, and the search and results area on the right.
- **StudentRecordSearch:** The live search box. It waits briefly after typing, then searches the backend and shows results. It supports mouse and keyboard selection.
- **ApplicationPayments:** Shows the selected student's summary tiles, paginated month list and Download PDF button.
- **downloadApplicationPaymentsPdf:** Requests the PDF from the backend with the login token and saves it to the user's computer.

Backend

- **Search endpoint** (/api/mini-sahana-form/search): Finds students matching the search text.

- **Payments endpoint** (GET /api/application-payments/:applicationId): Returns the paginated month list and totals shown on screen.
- **PDF endpoint** (GET /api/application-payments/:applicationId/pdf): Checks the login, builds the PDF and sends it as a download. It returns an error if the ID is missing or no payment records exist.
- **PDF usecase:** Fetches all months and totals, adds the applicant details from the latest report card, groups months by year and builds the PDF.
- **Repository:** Reads the report card data collection in MongoDB and flattens each card's months into one list with paid and unpaid totals.
