

Application Changes and Updates

1. Add a Reference Number

- Add a unique reference number to each application, starting with **REF1**.
- When an application is edited, the reference number must be updated accordingly (for example, **REF1** → **REF1.1**).
- This reference number change must happen for **both types of edits** described below.

2. Add Two Types of Edits

There will be two types of edits:

- **Normal Edit**
 - The user can edit all fields in the application **except the Account (ACC) Number**.
- **ACC Number Edit**
 - The user can edit **only the Account (ACC) Number** of the application.

3. Add a "Changes" Field

- Add a new field called **Changes** to the application dataset.
- This field should display the changes made to the application using an **Old vs New** format.
- First, display the **previous/existing data**, followed by the **new/updated data**.
- Each application must have its own unique **Changes** field.
- The Changes field can be empty when no changes have been made.
- This functionality must work for **both Normal Edits and ACC Number Edits**.

4. Track Who Created and Updated the Application

- Using the user token or another appropriate method, identify and record:
 - **Created By** – the user who originally created the application.
 - **Updated By** – the user who most recently updated the application.
- Save these values as fields in the application record.
- **Created By** must never be empty.
- **Updated By** can be empty when the application has never been updated.

5. Allow ACC Number Changes from Report Cards

- In the **Report Cards**, allow the user to change the ACC Number as well.
- If the user chooses to update the ACC Number from the Report Cards:
 1. The user should be automatically redirected to the **ACC Number Edit** for that application.
 2. The user can change the ACC Number there.

- 3. The new ACC Number should replace the existing ACC Number.
- When the user searches for the application afterward, the **latest version/copy** must be displayed.
- The application should be identified and searched using its **Reference Number**.

6. Search and Compare Application Versions

- After searching for an application, allow the user to preview both the **original version** and the **updated versions** of the application.
- The **latest version** should always be displayed in the search results.
- When the user wants to compare versions, only load the **previous version and the latest version**.
- Older versions do not need to be loaded for comparison.

Example:

- Suppose an application has 4 versions:
 - REF2
 - REF2.1
 - REF2.2
 - REF2.3
- When searching for the application, only **REF2.3 (the latest version)** should be displayed.
- If the user selects **Compare**, display only:
 - **REF2.2 vs REF2.3**
- There is no need to load REF2 or REF2.1 for the comparison.

7. View and Download Supported Documents

- When an application is searched, load the application details.
- Also allow users to **view and download the supported documents/files** associated with that application.
- Normally, there are **3 PDF files per application**, but sometimes there can be **4 PDF files**.

8. Update Existing Supported Documents

- Allow users to update the existing supported documents/PDF files.
- If a supported document is updated, the change must also be recorded inside the **Changes** field.
- The system must allow users to view both:
 - The **previous/existing PDF**
 - The **new/updated PDF**
- Make sure the PDF/document storage structure supports keeping both the old and new versions when documents are updated.

9. Fix the PDF Saving Issue

- Fix the existing **PDF saving issue**.
- Make the PDF saving functionality work in the same way as it currently works in the **Report Cards**.
